***Dear Editor,***

we would like to share ideas on “Knowledge, Attitude, and Acceptability of COVID-19 Vaccine in Oman: A Cross-sectional Study.”<sup>1</sup> According to Awaidy et al., participants' perceptions of the risk of contracting COVID-19, their trust in vaccines, their government, and their health system were significant predictors of vaccine acceptance. These findings allowed the development of strategies to address these concerns and promote vaccine acceptance among Omanese citizens.<sup>1</sup> We both believe that the success of the mass vaccination effort depends on public acceptance of vaccination. Numerous factors influence how people view the vaccine. The current investigation may provide insight into the state of affairs in Oman. However, circumstances might alter with time.<sup>2</sup> The acceptability of COVID-19 vaccine typically shifts when there is a change in the genetic epidemiology of the virus and when information about vaccination efficacy and safety is made available.<sup>2</sup> A lengthy follow-up research should be planned as an addition to the current cross sectional investigation.
